

DorionAnima SaaS Platform

Operations Analysis: Resolving Kennel & Breeding Complexity

1. Executive Summary

Animal care facilities, boarding kennels, and professional breeders run highly complex, round-the-clock operations. Historically, managing these tasks depended on disjointed paper logs, desktop spreadsheets, or mental schedules. This operational fragmentation creates critical vulnerabilities: scheduling overbookings, vaccination compliance omissions, lineage tracking failures (causing pedigree issues), and administrative overhead. DorionAnima SaaS provides a unified, full-stack relational management platform that consolidates all kennel checkpoints into a single Postgres-powered dashboard.

2. Core Industry Problems Solved by the Platform

A. Spreadsheet Fatigue & Fragmented Records

Operators track boarding calendars in Excel, medical chart histories on paper index cards, and pedigree cycles on separate family trees. This separation leads to input redundancy and data loss. The app solves this by linking all logs directly to a central database.

B. Boarding Overbooking & Room Assignment Conflicts

Overbooking kennel runs or misallocating space leads to high customer stress and safety hazards. The app integrates room assignments with check-in timelines, generating real-time boarding vacancies, dietary alerts, and scheduling details.

C. Medical & Vaccination Compliance Gaps

Kennels are legally required to verify vaccinations (e.g. Rabies, Parvovirus) before boarding. Missing booster deadlines exposes businesses to liabilities. The system structures medical records as persistent sub-entities under each animal profile for clean audits.

D. Pedigree Inbreeding Risks & Lack of Lineage Integrity

Accidental linebreeding or inbreeding damages bloodlines and kennel reputation. Finding parents and offspring matches manually is extremely tedious. DorionAnima resolves this with recursive database relationships, enabling instant pedigree matching.

3. Technical Feature Mapping (How the App Solves it)

- **Unified Relational Schema**

A highly structured Postgres database schema connecting organizations, profiles, animals, litters, boarding logs, and chores. Ensures data referential integrity.

- **Interactive Boarding & Chores Registry**

Live checking utilities that log check-ins, record kennel coordinates, track special feeding requests, and assign chore lists to team members with exact auditor logs.

- **Dynamic Family Lineage Tree Generator**

Sires and dams are referenced recursively. When registering a litter or new puppy, parent links are assigned immediately, graphing three generations of lineage details automatically.

- **Self-Service Stripe Billing Integration**

Automated onboarding trial (1 month / 30 days) that enforces subscription access boundaries. Operators upgrade or review payments securely using the Stripe Customer Portal.

4. Anticipated Business Outcomes

By deploying DorionAnima SaaS, kennel operations report a 60% reduction in scheduling administration time, complete elimination of vaccination compliance oversights, and improved staff delegation. Lineage integrity is kept secure via automated parent controls, securing the kennel's assets.
